

Cirqlback — Administrator Guide

Administrator · User Manual

For: platform administrators who oversee the whole Cirqlback system — users, businesses, coordinators, revenue share, and payouts. **Log in at:** `/auth` → **Admin Dashboard** at `/admin-dashboard`

1. How admin access works

- An admin is a **normal user account** that has been granted an **admin record** — there is **no separate admin sign-up page**. You register/log in at `/auth` like anyone else; your account is elevated to admin behind the scenes.
- Admins have a **level: master, platform, or support**. A **master** admin can invite and manage other admins.
- Every admin action is protected — the admin area and its APIs require a valid, active admin account. Non-admins simply can't reach it.

Provisioning the first admin: the very first admin is created directly in the database (register the account, then add its admin record). After that, a master admin can invite others from the dashboard.

2. The Admin Dashboard (`/admin-dashboard`)

The dashboard is organized into tabs:

TAB	WHAT YOU DO THERE
Users	Browse platform users and their status.
Templates	Manage campaign templates offered across the platform.
Subscriptions	Review subscription tiers and plans.
Analytics	Platform-wide performance and AI-assisted insights.
Payments	Payment/billing overview.
Coordinators	Set each coordinator's revenue-share % (see §4).
Platform	Global platform settings.

Your **admin level** (e.g. "Admin Access Level: Master") is shown at the top.

3. Managing admins (master only)

If you're a **master** admin:

- **Invite an admin** — send an invitation and set their admin level. Invited admins accept and gain access.
- **Manage status** — activate/deactivate admin accounts.
- Non-master admins can use the dashboard but can't invite or elevate others.

4. Coordinator revenue share (Coordinators tab)

This is where you control what each Community Coordinator earns.

1. Open the **Coordinators** tab.
2. You'll see each coordinator with their **name/email**, plan status, current **share %**, and a live "**platform keeps X%**" readout.
3. Type a new share in the box (a whole number **between 50 and 100**) and click **Save**.
 - The **default** is **70%** (coordinator) / **30%** (platform).
 - Values outside 50–100 (or non-whole numbers) are rejected — you'll see an error and nothing changes.
4. **Important:** a change applies to **future earnings only**. Each past charge already recorded keeps the rate it was charged at, so payouts stay accurate.

Use higher shares (toward 100%) for founding or high-performing coordinators, and lower shares (toward 50%) where the platform carries more of the load.

5. Coordinator payouts

Payouts are **reporting-based** — Cirqlback records what each coordinator has earned; you confirm when money is actually sent.

- **Generate a payout** for a coordinator (optionally for a specific month). This rolls up their **unpaid** earnings into a single **pending** payout and links those earnings to it. If there's nothing unpaid, you'll get a "nothing to pay out" message.
- **Mark a payout paid** (record a reference/notes) once you've sent the funds — or **void** it to release its earnings back to the unpaid pool.
- Coordinators see their pending and paid amounts in their own Revenue panel.

Automated payouts (e.g. Stripe Connect transfers) are a documented future enhancement; today the ledger is reporting-only and you settle out-of-band.

6. Pricing (how charges are set)

- Subscription and add-on prices are **defined server-side** — the amount a customer is charged never comes from the browser, so no one can pay the wrong price.
- Current plans: **Starter** (free trial), **Core** \$19.99/mo, **Pro** \$49.99/mo. Add-ons: Custom Branding \$7.99, Advanced Analytics \$12.99, Map Priority \$14.99, Scavenger Builder \$14.99.
- Changing a price is a code/config change (in the server price catalog), not something set through the UI — coordinate that with your engineering contact.

7. Payments & Stripe

- Payments run through **Stripe**. When a payment succeeds, Stripe notifies Cirqlback via a **signed webhook**, and the platform then **activates** the subscription or add-on and **attributes** the coordinator's revenue share — all automatically and verified server-side.
- For this to work in a live environment, the deployment needs valid Stripe keys and a configured webhook endpoint (an engineering/deploy task).

8. Security & good practice

- **Least privilege:** grant **master** only to those who need to manage other admins; use **platform/support** otherwise.
 - **Admin accounts are real logins** — protect passwords, don't share accounts, and deactivate admins who leave.
 - **Money-affecting actions** (revenue share, payouts) are logged by the changes they make; review the Coordinators tab and payout history when reconciling.
 - Customer data is minimal by design — customers are anonymous unless they opt in with an email.
-

9. FAQ

How do I create another admin? As a master admin, invite them from the dashboard and set their level; the first admin is seeded in the database.

I changed a coordinator's share — did it change past payouts? No. Only future earnings use the new rate; historical earnings keep their snapshot rate.

A coordinator says they weren't paid. Check their payout list — earnings may still be **unpaid/pending** until you **generate** and **mark paid** a payout.

Can I set a coordinator to keep 100%? Yes — the band allows 50–100 for special deals (the platform then keeps 0% on that coordinator's charges).

Where do I change a plan's price? In the server-side price catalog (an engineering change), not the admin UI — this keeps pricing tamper-proof.

Coordinator-side details are in the [Coordinator Guide](#); business features are in the [Basic](#) and [Pro](#) guides.
